

Auger electron spectra of alloys and synthesized : Fe-Ni's  
K. Goto

Nagoya Institute of Technology, Gokiso-cho, Showa-ku, Nagoya 466

The round robin sample (SAS; metal group) of Cu-Ni's have been measured and synthesized. The spectra shown (a,b, and c) are the spectra obtained from the Fe-Ni<sub>10</sub>7 (Ni:49 at%). The plasma loss and true secondaries can not be synthesized. The Fe-Ni<sub>10</sub>8 (Ni:68 at%) can be similarly synthesized, but the Fe-Ni<sub>10</sub>5 (Ni: 18 at%) is observed as to be Ni of 13 at%.
